                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

knall gas marine bacterium which grows optimally at 85 deg C and pH 6.8 It can be amplified from a pBluescript vector by FCK (see 6.8 It can be amplified from a pBluescript vector by FCK (see 6.8 It can be amplified from gloundleotides (AAT79321-30) encoding esterases (AAW23069-77, AAW23089) were recovered from genomic gene libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino group from an amino acid to an alpha-keto acid using a claimed esterase. The enzymes may also be useful as ripening starters in cheese making, in lighin removal in paper and pulp manufacture, in carbohydrate derivative synthesis, in the study of plant wall structure, plant lighted for production of highly degradable animal feeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         361 AGGGCTCTATACCTCTCGGAAGGGAGGTTTAATCCCCGCACTTCTCGGCAGCTGTGCAATT 420

This DNA sequence codes for thermostable esterase VF5-21LC (AAAW23074) of Aquifex VF5, a marine strictly chemolithoautotrophic knall gas bacterium that grows optimally at 85 deg C and pH 6.8.

It can be amplified from a Bluescript vector by PCR (see AAT79312-13). Claimed, newly identified polynucleotides (AAT79321-30) encoding esterases (AAW23069-77, AAW32089) were recovered from genomic libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino acid to an alpha-keto acid using a claimed esterase. Both organisms are closely related. Fragments of the nucleic acids are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleotide sequences AAZ11972-Z12358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see AAX3849-Y38944). The antigenic proteins, the fragments, their nucleic acids and antibodies are used for diagnosis,

The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences, AAA81260 to AAA81303 and AAA82520 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81312 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis MenB polymucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to

Attempts to make efficacious Meningococcus B vaccines have falled mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which are not antigenically variable or at least more conserved than other more variable regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes,

                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences which overlap each other at the beginning and end of each consequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21507 are repeated at the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the CR Reisseria proteins given in AABS8550 to AABS8593, and AAF21588 to AAF21588 to AAF21606 represent FCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. CR eisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the CR presence of Neisserial bacteria or as a diagnostic reagent endium or computer bacteria. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The present invention describes methods of obtaining immunogenic proteins from Neiseria genomic sequences. AAA81453 to AAA82414

proteins from Neiseria genomic sequences. AAA81453 to AAA82414

cepresent specifically claimed Neiseria meningitidis genomic DNA sequences; AAA81260 to AAA81261 to AAA81263 to AAA81264 to AAA81269 and AAA81304 to AAA81221 represent PCR primers used in the isolation of Neiseria meningitidis DNA sequences; and AAA8122 to AAA81259 and AAA81304 to AAA81221 represent PCR primers used in the cash protein sequences; and AAA8132 to AAA81452 represent Neiseria meningitidis MenB polymucleotide ORF sequences, which are all used in the exemplification of the present invention. The mucleic acid sequences protein sequences, and antibodies against them, can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition be used as a medicament (or in the manufacture of a composition be used as a medicament (or in the manufacture of a composition by a pational some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenia Neiseariae. Identification of sequences conserved matigenic variability. The provision of further, complete sequence may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than conserved than more variable regions.
